# 1 Core Concepts: The Foundation

## 1.1 Namespace (Virtual Clusters)

```
1 apiVersion: v1
2 kind: Namespace
3 metadata:
4   # 1. THE FOLDER NAME
5   # Think of this as a folder on your computer.
6   # Resources inside here are isolated from resources in other folders.
7   # You delete the Namespace -> You delete everything inside it.
8   name: production-env
```

Listing 1: Namespace Configuration

## 1.2 Pods (The Atomic Unit)

```
1 apiVersion: v1
2 kind: Pod
3 metadata:
4   # 1. THE POD'S ID CARD
5   # Unique name for this specific object.
6   # Used in commands like: 'kubectl delete pod my-first-pod'
7   name: my-first-pod
8
9   # 2. THE LOCATION
10  # Places this Pod inside the folder we created above.
11  namespace: production-env
12
13  # 3. THE STICKY NOTE (Categorization)
14  # Services use this label to find this Pod.
15  # It is arbitrary: you could say 'tier: backend' or 'fruit: banana'.
16  labels:
17    app: demo-app
18 spec:
19   containers:
20     # 4. THE INTERNAL NICKNAME
21     # Only used for logs: 'kubectl logs my-first-pod -c nginx-container'
22     - name: nginx-container
23
24     # 5. THE SOFTWARE PACKAGE
25     # Downloads 'nginx' version 'alpine' from Docker Hub.
26     image: nginx:alpine
27
28     ports:
29       # 6. THE EXPOSED PORT
30       # This is purely informational. It tells humans "I listen on port 80".
31       - containerPort: 80
```

Listing 2: Pod Configuration

## 1.3 Deployment (The Manager)

```
1 apiVersion: apps/v1
2 kind: Deployment
3 metadata:
4   # 1. THE MANAGER'S NAME
5   # This is the name of the Deployment object itself.
6   name: web-deployment
7   namespace: production-env
8 spec:
9   # 2. THE DESIRED TEAM SIZE
10  # "I want exactly 3 clones of this pod running at all times."
11  # If one dies, I will start a new one to keep this number at 3.
12  replicas: 3
13
14  # 3. THE SEARCH FILTER (Crucial!)
```

```

15 # The Manager asks: "Which pods belong to me?"
16 # Answer: "Any pod wearing the 'app: demo-app' badge."
17 selector:
18   matchLabels:
19     app: demo-app # <--- MUST MATCH Point #5 below
20
21 # 4. THE BLUEPRINT (Cookie Cutter)
22 # If I need to create a new Pod, I will use this template.
23 template:
24   metadata:
25     # 5. THE BADGE
26     # I will stick this label on every new Pod I create.
27     # This ensures the Selector (Point #3) can find them.
28     labels:
29       app: demo-app
30   spec:
31     containers:
32       - name: nginx
33         image: nginx:1.14.2

```

Listing 3: Deployment Configuration

## 2 Networking

### 2.1 Services (Internal Access)

```

1  apiVersion: v1
2  kind: Service
3  metadata:
4    # 1. THE DNS NAME
5    # Other pods can talk to this service by using this name.
6    # Example URL: "http://web-service"
7    name: web-service
8    namespace: production-env
9  spec:
10   # 2. THE TYPE OF ACCESS
11   # ClusterIP = Internal Only (Default).
12   # NodePort = Open a port on the server firewall.
13   # LoadBalancer = Ask AWS/GCP for a Public IP.
14   type: ClusterIP
15
16   # 3. THE TARGET FINDER
17   # "Send traffic to any Pod with this label."
18   selector:
19     app: demo-app
20
21   ports:
22     - protocol: TCP
23       # 4. THE FRONT DOOR (Service Port)
24       # This is the port other apps use to call the Service.
25       port: 80
26
27       # 5. THE BACK DOOR (Container Port)
28       # This must match the port your container is actually listening on.
29       targetPort: 80

```

Listing 4: Service Configuration

### 2.2 Ingress (External Routing)

```

1  apiVersion: networking.k8s.io/v1
2  kind: Ingress
3  metadata:
4    name: main-ingress
5    namespace: production-env
6    annotations:
7      # 1. THE CONTROLLER INSTRUCTION

```

```

8      # Specific configuration for Nginx (e.g., strip the path).
9      nginx.ingress.kubernetes.io/rewrite-target: /
10 spec:
11     # 2. THE POLICE OFFICER
12     # Tells the cluster which Ingress Controller should enforce these rules.
13     ingressClassName: nginx
14
15     rules:
16     # 3. THE DOMAIN NAME
17     # "I only care about traffic for myapp.com"
18     - host: myapp.com
19       http:
20         paths:
21         # 4. THE PATH RULE
22         # "If the user visits myapp.com/api..."
23         - path: /api
24           pathType: Prefix
25           backend:
26             service:
27             # 5. THE DESTINATION
28             # "...send them to the backend-service on port 5000."
29             name: backend-service
30             port: { number: 5000 }

```

Listing 5: Ingress Rules

## 3 Storage

### 3.1 PersistentVolume (The Hardware)

```

1  apiVersion: v1
2  kind: PersistentVolume
3  metadata:
4    # 1. THE HARD DRIVE NAME
5    # Managed by the IT Admin, not the Developer.
6    name: pv-10gb
7  spec:
8    # 2. THE SIZE
9    # How big is this physical disk?
10   capacity:
11     storage: 10Gi
12
13   # 3. THE ACCESS RULES
14   # ReadWriteOnce = Only one node can mount this at a time (like a USB stick).
15   # ReadWriteMany = Many nodes can share it (like a Shared Folder).
16   accessModes:
17     - ReadWriteOnce
18
19   # 4. THE DRIVER
20   # "hostPath" uses the Node's local disk (Testing only).
21   # In production, use 'awsElasticBlockStore' or 'gcePersistentDisk'.
22   hostPath:
23     path: "/mnt/data"

```

Listing 6: PV Definition

### 3.2 PersistentVolumeClaim (The Ticket)

```

1  apiVersion: v1
2  kind: PersistentVolumeClaim
3  metadata:
4    # 1. THE TICKET NAME
5    # The Pod will use this name to claim storage.
6    name: db-storage-claim
7    namespace: production-env
8  spec:
9    # 2. THE REQUEST

```

```

10  # "I need a drive that supports Single-Node writing."
11  accessModes:
12    - ReadWriteOnce
13  resources:
14    requests:
15      # 3. THE SIZE NEEDED
16      # "Find me a PV that has at least 5GB free."
17      storage: 5Gi

```

Listing 7: PVC Request

## 4 Batch Jobs

### 4.1 CronJob (Scheduled)

```

1  apiVersion: batch/v1
2  kind: CronJob
3  metadata:
4    name: nightly-backup
5  spec:
6    # 1. THE SCHEDULE
7    # Minute | Hour | Day-Month | Month | Day-Week
8    # "Run at 00:00 (Midnight) every day."
9    schedule: "0 0 * * *"
10
11   # 2. THE JOB TEMPLATE
12   # Every midnight, create a Job object with these settings.
13   jobTemplate:
14     spec:
15       # 3. THE POD TEMPLATE
16       # The Job will create a Pod with these settings.
17       template:
18         spec:
19           containers:
20             - name: backup
21               image: backup-tool
22
23           # 4. THE RESTART POLICY
24           # "If the script crashes, try again (OnFailure)."
25           # "Do not restart endlessly like a web server."
26           restartPolicy: OnFailure

```

Listing 8: CronJob Example

## 5 Mini Project: Full Stack

### 5.1 Backend (Python API)

```

1  apiVersion: apps/v1
2  kind: Deployment
3  metadata:
4    name: backend-api
5  spec:
6    replicas: 2
7    selector: { matchLabels: { app: backend } }
8    template:
9      metadata: { labels: { app: backend } }
10     spec:
11       containers:
12         - name: python-api
13           image: my-python-api:v1
14
15       # 1. CONNECTING TO REDIS
16       # We don't use IP addresses. We use the Service Name.
17       env:
18         - name: REDIS_HOST

```

```

19         # This name 'redis-service' matches the Service YAML below.
20         value: "redis-service"
21     ---
22     apiVersion: v1
23     kind: Service
24     metadata:
25       name: backend-service
26     spec:
27       # 1. INTERNAL ONLY
28       # The public cannot access the API directly. Only the Frontend can.
29       type: ClusterIP
30       selector: { app: backend }
31       ports: [{ port: 5000, targetPort: 5000 }]

```

Listing 9: Backend Deployment

## 5.2 Frontend (React)

```

1  apiVersion: apps/v1
2  kind: Deployment
3  metadata:
4    name: frontend-ui
5  spec:
6    replicas: 3
7    selector: { matchLabels: { app: frontend } }
8    template:
9      metadata: { labels: { app: frontend } }
10     spec:
11       containers:
12         - name: react-ui
13           image: my-react-app:v1
14
15       # 1. CONNECTING TO BACKEND
16       # The frontend browser needs to know where to send API requests.
17       env:
18         - name: API_URL
19           value: "http://backend-service:5000"
20     ---
21     apiVersion: v1
22     kind: Service
23     metadata:
24       name: public-frontend
25     spec:
26       # 1. PUBLIC ACCESS
27       # This asks the Cloud Provider (AWS/GCP) for a Real Public IP.
28       type: LoadBalancer
29       selector: { app: frontend }
30       ports:
31         - port: 80           # Users hit port 80 (HTTP)
32           targetPort: 80     # Container listens on 80

```

Listing 10: Frontend Public Access
